This policy has been in effect since company's incorporation and has helped the organization for customer need.

We Deals In:

- **CHEMICAL** for all types of plant like IBR / NON IBR Boiler, Water Treatment Plant and Testing Kit .
- **SPARE** for All type of plant like IBR / NON IBR Boiler, Hot Water generator, Hot Air generator, Thermic fluid heater, Water Treatment Plant, and burners,
- **SERVICE** for All type of plant like IBR / NON IBR Boiler, Hot Water generator, Hot Air generator, Thermic fluid heater, Water Treatment Plant, Burners and Panel Wiring
- **PIPELINE** for (GI, MS,) Fire line, Steam line, Air Line, Diesel Line, Gas line, Water line and new installation old repairing and insulation.
- **TANK** for all type of MS / SS air receiver tank, clarifier tank, water tank, Diesel Tank
- **AMC** for All type of plant like IBR / NON IBR Boiler, Hot Water generator, Hot Air generator, Thermic fluid heater, Water Treatment Plant, and Gas/Oil fired burners,
- **TECHNICAL** for repairing of all types of heating equipments ,water treatment plant, burners, and fault finding in plants and repairing the same.

Heat Process Equipment:

We provide Sale, Service, and Installation of New and Old Boiler and heat equipment. Heating Equipment caters to the process heating needs of the widest possible range of industries. Boilers are systems designed for heating air or water to produce heat or energy. They can be incredibly simple or fairly elaborate, but basic models are made up of an enclosed container where heat is applied to water, which is then circulated throughout the system in the form of hot water or steam. The water must be boiled to create steam, giving the device its name.

Many home heating system and water heaters that use boilers don't actually boil the water, however. Instead, water is generally heated to temperatures somewhere roughly between 140° and 200°F (42.14° to 93.3°C), although some people lower the settings to save energy and money. Much like a typical furnace heats air, boilers heat water or other heating fluids. The heated liquid then passes through pipes rather than ductwork to a particular heating implement, such as a radiator, to disburse heat. With radiant heating systems, sometimes referred to as heated floors, pipes can be placed in the floor or ceiling. The water is heated, and then moved through the pipes, which distribute heat throughout the space instead of at the end of a line via some other form of heating implement.

Water Treatment Equipment:

We provide Sale, Service, and Installation of Water Treatment Plant, RO Plant, Sewage Treatment Plant and other Water Treatment Equipment which are used in Industries. Water treatment describes those industrial-scale processes used to make water more acceptable for a desired end-use. These can include use for drinking water, industry, medical and many other uses. Such processes may be contrasted with small-scale water sterilization practiced by campers and other people in wilderness areas. The goal of all water treatment process is to remove existing contaminants in the water, or reduce the concentration of such contaminants so the water becomes fit for its desired end-use.

The processes involved in treating water for drinking purpose may be solids separation using physical processes such as settling and filtration, and chemical processes such as disinfection and coagulation.

Our Expertise:

Our proven expertise and state of art deployment provides seamless professional solutions and services to its clients in the broad domains of:

- Timely Completion of the project
- Offer unique quality of service
- Make the Technology simple and friendly to users
- Build on our Strengths, Invest in our Staff and giving Value to our Environment.

Delivery:

Delivery is not just about providing boxes and satisfy at the customer's doorstep but to delight them by providing them the best services what we are committed for.
