Mahogany Teak Plant Cultivation

✚ INTRODUCTION:

Mahogany is a kind of wood with straight grained, reddish brown timber. The three species are *Swietenia macrophylla*, *Swietenia mahogany* and *Swietenia humilis*. *Swietenia* species are classified officially as "genuine mahogany". Mahogany is a commercially important lumber prized for its beauty, durability and color and used for paneling and to make furniture, boats, musical instruments and other items.

The Mahogany tree "*SWEITENIA*" which grow as natural populations in tropical America, Asia and Africa is a high value timber tree known for its redwood color, strength, durability, water resistance and aesthetic appeal. The Mahogany tree can grow over 60 to 70 Ft. high and reaching around 4 to 5 Ft. diameter.

Mahogany is the most prized timber tree of India. It can be grown in almost every part of the country except the dry western zone, although the best Mahogany Plant develops in well drained deep alluvial soil.

✚ Usage:

Due to the durability of Mahogany in all the hardwoods it can be used for anything. It is used for making furniture, flooring, boats and many more. The continual increasing demand for hardwood timber, Mahogany can offer a tax effective investment in forestry make mahogany most demanding timber plant in this region.

✚ Land Preparation:

Prior to planting Mahogany, it must be ensured that the selected site is well thoroughly cleared of weeds. Dig pit of size 1.5x1.5x1.5ft. During digging of the pit, care should be

thoroughly cleaned of weeds. The pit mixture should compose of well decomposed organic manure (FYM or compost), de-oiled neem cake and Top soil (kept aside during digging of the pit.) The pit mixture is prepared by thoroughly mixing equal parts of organic manure and topsoil, along with 200 grams of de-oiled neem-cake. The pit-mixture thus prepared, should be used for filling the pit.

✚ Procedure of Planting:

- 1) Dig the pit and keep it open for 1-2 weeks.
- 2) Then close the pit with the soil available with digging.
- 3) After 2 days, open the pit slightly 1/2 feet, put Organic Manure (Vermicompost) of 0.5 kg for each pit and plant the seedling. If sapling height is more, can use support pole for each pit to avoid breaking of sapling.
- 4) And irrigate in same day.

✚ Spacing & Pit Filing:

The pits must be filled as much as possible, only with the prepared pit-mixture. If the topsoil is insufficient, coarse river sand may be used as an inert substitute, which also increases porosity and aeration. A peg may be placed in the Centre of the pit for identification during planting. The pits must be filled at least 2 weeks before planting, to allow for the pit-mixture to settle. The recommended spacing for the plant is a square or triangular grid type with dimension of 6.0 X 6.5 ft. or 8 ft X 8 ft or 10X 10 ft.

Irrigation:

Watering has to be done immediately after planting. During the first two week watering should be done alternate day. Subsequently irrigation can be done once in 3 to 4 days depending upon the soil and weather conditions. In non-irrigated lands micro-irrigation systems are recommended.

Fertilizers Application & Doses:

First year N: P: K (17:17:17) & Micro Nutrients 200gms. / Plant / month, except dormancy (Dec - Jan) period. Every month this has to be split and applied through pocket manuring. Make a hole 1 ft. away from the plants and the depth of the pit should be 1 ft. Apply the fertilizer in the hole and fill it with the soil. Micro nutrient application 1 gm / lt. Of water, foliar application once in 15 days for 1 year.

Maintenance:

The site must be cleaned of weeds and the soil around the plant should be kept loose and well aerated. Mahogany can grow on a variety of soils. The quality of its growth, however, depends on the depth, structure, porosity, drainage and moisture-holding capacity of the soil. It develops best on deep, well-drained and fertile soils. Mahogany prefers moist, warm tropical climate. It can withstand extremes of temperature, but maximum & minimum shade temperatures of 25- 44. 0 c is the most favorable for its growth. It grows well in rainfall zone of 1200-2500 mm. It prefers a deep, fertile. The sandy soil is considered to be the best soil texture for this tree. It fails to grow in the soil with pH below 6.5. The calcium content of the soil is also an important factor; calcium deficiency in the soil results in stunted growth of Mahogany Planting.

Yield and Harvesting Returns:

The highest growth is recorded under plantation condition in BIHAR and tarai belt of NEPAL. At 10 years of age the height growth was 23.1m and diameter was 28.7 cm. From the general yield table in the first quality Mahogany at 10 years of age, the average diameter is 27.2 cm and average height is 23.2m.

The number of trees per acre is 1200-1500. The total yield of stem timber is about 36000 Cft timbers on good sites. At the best we may expect a tree to produce a maximum of 20 Cft of timber in 10 years under best conditions of intensive management and there could be a maximum of 1500 trees per acre.

✚ Economic Of One Acre Stevia Cultivation:

Expenditure:

Distance (in acre)	Sapling (in land)	Cost of plants (per plants)	Total	Other Expenses (As Per Requirement)	Cost of cultivation
6X6 ft	1200 Plant	80 Rs	1200X80= 96,000	Fertilizers Land preparation Labor expenses etc.	96,000
Total Cost of Cultivation: 96,000/-					

✚ Income:

Income in year	Cut ft. (Per Tree)	Total Cut from Tree (Approximated)	Companies buy back (Per cut ft.)	Total (Approximated)
In 12 th year	20 cu.ft. per tree	20 cu.ft X1200 tree= 24000 cu. ft.	Rs. 250/-per cu.ft	24000 cu. ftX250 Rs. /-per cu.ft = 60,00,000
Total 12years Income: 60,00,000/-				

Technical Support & Services:

We also provide technical support for farming. Our Service Department with technically qualified staff provide after sales service and farmers advisory services to our customers to get better plant establishment and faster growth of Herbal and Horticultural plantations.

We have largest network of employees who deliver Plants to customers at their door steps. Free technical services to customers on planting method, management practices and plant protection measures. Our teams of Agricultural Experts periodically visit and supervise the plantations and suggest necessary guidelines to get better growth and higher returns. Services:

- This includes Supervision, consultancy, guidance, Transportation cost first year.
- First production starts after 12th year.
- Buy back agreement of Mahogany.
- The income expenditure indicated by the company is an approximated figure, as it also depends on the nature and hard work of the farmer

Terms And Conditions:

1. For 1 Acre plantation the cost of Plants is Rs. 96,000/-, out of which 50% has to be paid before the cultivation and the remaining half after the planting is done.
2. The Buy Back Agreement Stamp paper of Rs.100/- has to be stamped by District Court of your area.
3. For 10 Acre or more yield the buy Back Agreement Stamp Paper will be of Rs.500/-.

***("Look deep into nature,
and then you will understand everything
better")***
